

# GLIMPSES OF PITTSBURGH

Pittsburgh is a global leader, in terms of sustainability and as a model of post-industrial revival. The Roof Deck of the US Steel Tower, which stands as, 'the largest high space on top of any building on earth,' therefore should highlight these attributes. Through the integration of sustainable power generation capabilities (wind turbines, solar PV panels and a rain water capture system) with breath-taking views of the city and its surroundings, the US Steel Tower will become a beacon for continued growth and progress. The downward (towards the edges) sloping ramps allow for both an uninterrupted panoramic and various 'glimpses' of the city, from unparalleled vantage points, as well as being one of the largest public gathering spaces in the Central Business District.
